Revocred 31-Day Launch Plan (Free-First Monetization)

Goal: Launch Revocred on the Apple App Store in 31 days with a free-first model to maximize adoption and collect proof of demand before turning on subscriptions.

Executive Summary

- Yes, a 31-day launch is realistic if we remove Apple account blockers quickly and execute in focused work blocks.
- Initial launch is free. Revenue optimization is phase 2 once real user behavior data is collected.
- Critical external dependency: active Apple Developer account + App Store Connect access.

Launch Strategy: Free First, Monetize After

- Phase 1 (Launch): Keep core features open to all users to maximize installs and engagement.
- Phase 2 (Validation): Measure retention, REVO usage, and qualitative feedback.
- Phase 3 (Monetization): Turn on subscriptions with Apple IAP once premium value is proven.

31-Day Timeline

- Days 1–3: Apple distribution unblock (Developer account, App Store Connect, TestFlight readiness).
- Days 4–10: Product readiness (free launch instrumentation, event analytics, crash monitoring, feature flags).
- Days 11–16: Reliability and compliance (legal pages, privacy details, export compliance, support channel).
- Days 17–21: QA and polish on iPhone (critical path testing, bug fixes, performance polish).
- Days 22–25: App Store assets (screenshots, listing copy, keywords, metadata, policy links).
- Day 26: Submit build to App Store review.
- Days 27–31: Review buffer for fixes/resubmission if needed.

Must-Have Tooling for a Real Business

- App + Backend: Expo/React Native, Supabase, OpenAI (already in place).
- Distribution: EAS Build + App Store Connect + TestFlight.
- Analytics: PostHog or Mixpanel (funnel + retention).
- Monitoring: Sentry (crashes/errors).
- Payments (later): Apple IAP (and optional Stripe for web channel later).
- Operations: support inbox (Crisp/Intercom), legal docs, domain + marketing page.

Launch Readiness Checklist (Minimum)

- Apple account active and app record configured in App Store Connect.
- At least one successful TestFlight build installed on real iPhone.
- Core user journey tested end-to-end (signup/login -> Home -> REVO -> Profile).
- Crash-free baseline established in TestFlight testers.
- Privacy Policy + Terms accessible from app and store listing.
- App Store assets finalized and submission metadata complete.

Post-Launch KPI Targets (First 2 Weeks)

- Activation: % of new users who ask REVO at least once.
- Engagement: average REVO prompts per active user.
- Retention: D1 and D7 return rates.
- Reliability: crash-free sessions and API success rate.
- Monetization readiness: identify top premium candidate features from usage patterns.

Immediate Next Actions

- 1) Resolve Apple Developer account creation issue (highest-priority blocker).
- 2) Complete first iOS TestFlight build path.
- 3) Add analytics events and crash monitoring before submission.
- 4) Finalize legal and App Store metadata package.
